# Blast Alarms for Mining

With the simple press of a button or code entry on their Tetra radio, users on a mine site can activate and deactivate blast alarms. TetraFlex will recognise this SDS call and then play a wave file alarm across all radio Talkgroups on site. A user customised text message can also accompany the alarm to provide detailed information on blast status, location etc. Radio users can still talk normally on their designated user group, however they will hear the blast alarm intermittently in the background.

- Continuous Blast Alarm across the network.
- Simple one button press activation.
- Talkgroup selection
- Wave file selection (4 to choose from Wave 0 - 4)
- Number of repeat cycles to play-out wave file
